

# Movie Theater ERD (Entity Relationship Diagram)

Supportive Claims: Above we see a few relationships already established. We have four tables. The first relationship is for when a customer enters the theater and begins their experience. That is paired with *total\_cost* of the Tickets table. This is because the first step to seeing a movie in person is purchasing a ticket. From there *total\_cost* meets *order\_date* to understand when the ticket was purchased. This is also in a relationship with *film\_name*. This tells us what movies are playing on those dates. Finally, we form a relationship between *genre* and *tic\_id* to tell us what genre the movie on the *tic\_id* is.
